TITLE : RESIN SHEET CONVEYANCE DEVICE

ABSTRACT : PROBLEM TO BE SOLVED: To provide a resin sheet conveyance device which is of a simple structure and advantageous for investment in equipment and further is suited for conveying the resin sheet such as a skin to a heating step, a pressing step or the like.

SOLUTION: This resin sheet conveyance device has the main part of a conveyance frame 4 constituted of a body frame part 5 for supporting one of the peripheral edge parts of the long side of a rectangular resin sheet, a pair of extendable frame parts 6 which are way out of both ends of the body frame part 5 and are extendable/ shrinkable and an openable frame part 7 which is openable/closable at the tip of the extendable frame parts 6. In this case, an interval between the body frame part 5 and the openable frame part 7 which is set in a closing position is variably adjusted against the width of the resin sheet and thereby, the two peripheral edge parts of the long side of the resin sheet are supported by the frame parts 5, 7 in a freely detachable manner. Further, the resin sheet is horizontally conveyed in such a state that it is extended as it is in the short side direction. After that, the openable frame part 7 is opened to detach a conveyance frame 4 from the resin sheet, halfway through the fabrication of the center part of the resin sheet, when the fabrication is executed.
